EXAMINER'S AMENDMENT

1. This Office Action is responsive to the Amendment filed on 10/19/06.
2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

IN THE ABSTRACT:

-On lines 1 and 2, the phrase "means of an error correcting code" is changed to --a use of an error correcting code--.

3. Note that the above amendment is needed because the form and legal phraseology often used in patent claims, such as "means" should be avoided in patent abstracts. See MPEP 608.01(b).

REASONS FOR ALLOWANCE

4. Claims 1-24, 26-32, and 35-61 are allowed.
5. The following is an examiner's statement of reasons for allowance:

-Regarding to independent claims 1 and 61, none of prior of record teaches or suggests a method including a frequency mapping operation of associating with a sequence of encoded symbols K frequency symbols in a frequency space consisting of an ordered series of 2^p increasing frequencies, periodically spaced apart and associated with an amplitude, each of said K frequency symbols representing N encoded symbols, p, K and N being strictly positive integers; an inverse transformation operation of applying to the K frequency symbols a reversible

transformation including a multiplication by an invertible matrix of size $N \times N$, so as to obtain inverse transform signals; and a transmission operation of sending over a transmission channel signals obtained from said inverse transform signals in which there exists a K -tuple of positive integers n_1, n_2, \dots, n_K , at least one of which is strictly positive, such that, for an integer i varying from 1 to K , after periodic extraction of one frequency out of 2^{n_i} amongst the frequencies of the i^{th} of said K frequency symbols, thus forming a reduced frequency symbol with 2^{p-n_i} frequencies, a set of K reduced frequency symbols is obtained, representing said original information sequence, with a view to a complete or partial decoding.

-Regarding to independent claim 10, none of prior art of record teaches or suggests a device including frequency mapping means, for associating with said sequence of encoded symbols K frequency symbols in a frequency space consisting of an ordered sequence of 2^p increasing frequencies periodically spaced apart and associated with an amplitude, each of said K frequency symbols representing N encoded symbols, p , K and N being strictly positive integers; inverse transformation means, for applying to said K frequency symbols a reversible transformation including a multiplication by an invertible matrix with a size $N \times N$, so as to obtain inverse transform signals; and transmission means, for sending over a transmission channel signals obtained from said inverse transform signals in which there exists a K -tuple of positive integers n_1, n_2, \dots, n_K , at least one of which is strictly positive, such that, for an integer i varying from 1 to K , after periodic extraction of one frequency out of 2^{n_i} amongst the frequencies of the i^{th} of said K frequency symbols, thus forming a reduced frequency symbol with 2^{p-n_i} frequencies, a set of K reduced frequency symbols is obtained, representing said original information sequence, with a view to a complete or partial decoding.
